

CLOUD SERVICES

Deploy cloud services for availability, scalability and mobility.

Dataware's cloud services provide many IT services traditionally hosted in-house, including provisioning an application/database server from the cloud, replacing in-house storage/backup with cloud storage and accessing software and applications directly from a web browser without prior installation.

Dataware provides three basic types of cloud services:

1. Software as a Service (SaaS),
2. Infrastructure as a Service (IaaS) and
3. Platform as a Service (PaaS)

These Cloud services provide great flexibility in provisioning, duplicating and scaling resources to balance the requirements of users, hosted applications and solutions. These services are built, operated and managed by Dataware, working to ensure end-to-end availability, reliability and security of the cloud.
